

Laravel Interview Questions & Answers

Q: *What is Laravel?*

A: Laravel is a free, open-source PHP framework used for web application development following the MVC architecture. It provides features like routing, middleware, authentication, queues, and caching.

Q: *Explain MVC in Laravel.*

A: MVC stands for Model-View-Controller. Model handles data and business logic, View handles UI, and Controller manages communication between Model and View.

Q: *What is Artisan in Laravel?*

A: Artisan is Laravel's command-line interface. It provides useful commands for database migration, controller creation, cache clearing, and more.

Q: *What are Migrations in Laravel?*

A: Migrations are version control for databases. They allow developers to modify and share the application's database schema in a team-friendly way.

Q: *What is Eloquent ORM?*

A: Eloquent is Laravel's built-in ORM for database interaction. It provides an ActiveRecord implementation to work with databases using models instead of raw SQL queries.

Q: *Explain Middleware in Laravel.*

A: Middleware provides a way to filter HTTP requests entering your application. Example: authentication check before accessing a route.

Q: *What are Service Providers?*

A: Service Providers are the central place of all Laravel application bootstrapping. They register services, bindings, and event listeners.

Q: *What is the difference between Authentication and Authorization?*

A: Authentication verifies a user's identity (login), while Authorization determines what actions the authenticated user is allowed to perform.

Q: *Explain CSRF Protection in Laravel.*

A: Laravel automatically generates a CSRF token for each active user session. It helps protect applications from cross-site request forgery attacks.

Q: *What are Laravel Guards?*

A: Guards define how users are authenticated for each request. Laravel provides default guards like 'web' and 'api' but custom guards can be created.

Q: What are Laravel Policies?

A: Policies are classes that organize authorization logic for specific models. Example: only the owner of a post can edit it.

Q: What is Queue in Laravel?

A: Queues allow you to defer the processing of a time-consuming task (like sending emails) until later, improving performance.

Q: What are Events and Listeners in Laravel?

A: Events are actions that occur, and Listeners are classes that handle those events. Example: UserRegistered event triggers SendWelcomeEmail listener.

Q: How do you create a custom validation rule in Laravel?

A: You can create a custom rule using ``php artisan make:rule RuleName``, then define the logic in the ``passes`` method.

Q: What are Laravel Collections?

A: Collections are wrapper classes around arrays that provide a fluent, convenient interface for working with data.

Q: What is Laravel Passport?

A: Laravel Passport provides a full OAuth2 server implementation for API authentication.

Q: What is Laravel Sanctum?

A: Sanctum provides a simpler authentication system for SPAs, mobile apps, and APIs without the complexity of OAuth.

Q: What is the difference between Laravel and Core PHP?

A: Core PHP is basic PHP coding without structure. Laravel provides a structured framework with built-in features like routing, authentication, and ORM.

Q: What is the latest version of Laravel (2025)?

A: As of 2025, the latest version is Laravel 11, which brings performance improvements, typed properties, and improved queue handling.
